ThalassemiaFoundation
of Canada

Thalassemia is a genetic blood disease. People born with this disease cannot produce normal hemoglobin which is needed to make healthy red blood cells. Thalassemia is not infectious and cannot be passed from one individual to another by personal contact. The only way to know if you carry the Thalassemia trait is to have a special blood test called hemoglobin electrophoresis. If you are in an at-risk group, request a test from your doctor. The combination of one gene from the mother and one from the father leads to three different types of Thalassemia: Thalassemia Minor, Thalassemia Intermedia, or Thalassemia Major.
